PRN: 16070122518

Semester: III

Year : AY 2026-27

Subject: Programming with Java

ASSIGNMENT No : 4

TITLE : Wrapper Classes in Java

Problem Statement

Develop a Java application demonstrating the use of wrapper classes for conversion between primitive data types and objects, and performing basic operations on wrapped values.

Learning Objectives

To perform conversion between primitive data types and wrapper objects using Java wrapper classes.

Programme

```
J WrapperDemo.java •
J WrapperDemo.java
1  class WrapperDemo
2  {
3
4      public static void main(String[] args)
5      {
6
7          // Primitive Data Type
8          int num = 100;
9
10         System.out.println("Primitive int : " + num);
11
12         // Primitive to Object
13         Integer obj= Integer.valueOf(num);
14
15         System.out.println("Wrapper Object : " + obj);
16
17         // Unboxing (Object to Primitive)
18
19         int value= obj;
20         System.out.println("Primitive after Unboxing : " + value);
21
22         // Basic Operation
23         int sum = obj + 50;
24
25         System.out.println("Addition : " + sum);
26
27         // Wrapper Class Method
28         String str = "250";
29
30         int number= Integer.parseInt(str);
31         System.out.println(" Converted String to int : " + number);
32     }
33 }
```

Output

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS CODE REFERENCE LOG
piyushrohokale@Piyushs-MacBook-Air assignment04 % javac WrapperDemo.java && java WrapperDemo
Primitive int : 100
Wrapper Object : 100
Primitive after Unboxing : 100
Addition : 150
Converted String to int : 250
piyushrohokale@Piyushs-MacBook-Air assignment04 %
```

Conclusion

The program successfully demonstrates the use of Java wrapper classes. It performs primitive to object, object to primitive, and basic arithmetic operations on wrapped values. It also uses the `Integer.parseInt()` method to convert a String into a primitive int, showing how wrapper classes simplify data conversion and manipulation.
