

Name of Student: Vyankatesh Rohokale	PRN: 26070122518
Semester: III	Year : AY 2026-27
Subject: Programming with Java	
ASSIGNMENT No : 19	
TITLE : JDBC SELECT Operation	

Problem Statement

Develop a Java application to establish connectivity with a database and perform data retrieval using the SELECT operation.

Learning Objectives

To establish database connectivity and retrieve records using JDBC SELECT statements.

Programme

1. Create a Java application to display **student records from database** using SELECT query

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

public class EmployeeRecords
{
    public static void main(String[] args) throws Exception
    {
        Class.forName("com.mysql.cj.jdbc.Driver");
        String db = "jdbc:mysql://localhost:3306/employee";
        String user = "root";
        String password = "admin@123";

        try {
            Connection con = DriverManager.getConnection(db,
            user, password);

            System.out.println("Connection established");
            String query = "SELECT * FROM employee";
            Statement stmt = con.createStatement();
            ResultSet rs = stmt.executeQuery(query);
            System.out.println("\nEmployee Records");
```

```

        System.out.println("-----");
        while (rs.next()) {
            System.out.println("Employee ID: " +
rs.getInt("e_id"));
            System.out.println("Employee Name: " +
rs.getString("e_name"));
            System.out.println("Employee Salary: " +
rs.getDouble("e_sal"));
        }
        System.out.println("-----");
        rs.close();
        stmt.close();
        con.close();
    } catch (Exception e) {
        System.out.println("Error: " + e.getMessage());
    }
}

```

Output :

```

piyushrohokale@Piyushs-MacBook-Air JDBC % javac -cp lib/mysql-connector-j-26.7.0.jar src/EmployeeRecords.java
piyushrohokale@Piyushs-MacBook-Air JDBC % java -cp "src:lib/mysql-connector-j-26.7.0.jar" EmployeeRecords
Connection established

Employee Records
-----
Employee ID: 1
Employee Name: vyankatesh
Employee Salary: 12345.0
piyushrohokale@Piyushs-MacBook-Air JDBC %

```

2. Create a Java application that connects to a database and displays product details using a SELECT query. Show product ID, product name, quantity, and price.

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

public class ProductDetails {

    public static void main(String[] args) throws Exception {

        Class.forName("com.mysql.cj.jdbc.Driver");

        String db = "jdbc:mysql://localhost:3306/employee";
        String user = "root";
        String password = "admin@123";

        try {

```

```

        Connection con = DriverManager.getConnection(db,
user, password);

        System.out.println("Connection established");

        String query = "SELECT * FROM product";

        Statement stmt = con.createStatement();

        ResultSet rs = stmt.executeQuery(query);

        System.out.println("\nProduct Details");
        System.out.println("-----");

        while (rs.next()) {
            System.out.println("Product ID: " +
rs.getInt("product_id"));
            System.out.println("Product Name: " +
rs.getString("product_name"));
            System.out.println("Quantity: " +
rs.getInt("quantity"));
            System.out.println("Price: " +
rs.getDouble("price"));

System.out.println("-----");
        }

        rs.close();
        stmt.close();
        con.close();

    } catch (Exception e) {
        System.out.println("Error: " + e.getMessage());
    }
}
}

```

```

piyushrohokale@Piyushs-MacBook-Air JDBC % java -cp "src:lib/mysql-connector-j-26.7.0.jar" ProductDetails
Connection established

Product Details
-----
Product ID: 1
Product Name: Laptop
Quantity: 10
Price: 55000.0
-----
Product ID: 2
Product Name: Mouse
Quantity: 25
Price: 800.0
-----
Product ID: 3
Product Name: Keyboard
Quantity: 15
Price: 1500.0
-----
piyushrohokale@Piyushs-MacBook-Air JDBC %

```

Conclusion

The program successfully demonstrates how to connect a Java application to a MySQL database and retrieve product details using a SELECT query. JDBC classes such as Connection, Statement, and ResultSet are used to execute the query and display the product ID, product name, quantity, and price.
